This master’s programme emphasizes experimental computer science, rather than theory, and typically requires design, implementation, testing, and performance analysis of software for advanced parallel and distributed systems. It contains a balance between classes and practical work: about one third of the first three semesters consists of practical projects. The final semester is a master's thesis, which will usually involve doing research in conjunction with one of the faculty members. In contrast to other master’s programmes, PDCS requires that students explicitly apply to be admitted. Up-to-date information can be found at the FEW-website.

Optional Courses

Opleidingsdelen:

- Individuele vakken

Vakken:
### Compulsory Courses

The courses
- Advanced Topics in Computer and Network Security
- Advanced Topics in Distributed Systems
- Research Proposal Writing
- Master Project PDCS

are part of the second year of the curriculum.

Compulsory alongside the below mentioned courses (78 credits), are
- optional courses Theoretical Computer Science 6 credits
- optional courses Programming 6 credits
- optional courses Computer Sciences 30 credits

Note: Every programme, including the choice of optional courses, has to be discussed and agreed upon with the master coordinator or a personal mentor and approved by the Examination Board.

**Lesmethode(n)**
Hoorcollege, Werkcollege

**Niveau**
500

**Doel vak**
The objective is to obtain a good understanding of modal logic and its use in computer science and artificial intelligence.

**Inhoud vak**
A thorough introduction to modal logics, and its applications in computer science and artificial intelligence. We will select some themes from the book Modal Logics for Open Minds, by Johan van Benthem: basic modal logic and possible world semantics, bisimulation and invariance, modal definability, decidability, ... In particular we treat the modal logics most relevant to computer science and AI: temporal, dynamic and epistemic logic.

**Onderwijsvorm**
Weekly 2 lectures and 1 exercise class, for the duration of 7 weeks.

**Toetsvorm**
A written exam and assignments that can make half a point bonus.

**Literatuur**
Johan van Benthem, Modal Logics for Open Minds, CSLI Publications 2010.

**Aanbevolen voorkennis**
The bachelor course Logica en Modelleren (previously Inleiding Logica), or an equivalent introduction to first-order logic.

**Doelgroep**
mAI-KTIIA, mAI-TLI, mAI-C-var, mCS-FMSV

Advanced Topics in Computer and Network Security
Doel vak
The goal of this course is for students to develop an in-depth understanding of classical and recent research in system and network security, and practice their presentation and argumentation skills. The class is restricted only to PDCS students so that individual guidance can be offered.

Inhoud vak
The course takes the form of seminars based on a selection of papers that either have had a strong impact on security today, or explore novel ideas that may be important in the future. Students are required to read all papers assigned during the semester and be able to competently discuss the material in class. Each student will be responsible for presenting one lecture -- that lecture will be based on the assigned paper for the week including as much relevant related work as necessary to distill the work presented in the paper. The speaker will have 25 minutes talk to present the papers she read. The presentation will be followed by 20 minutes of interactive discussion in the class. Before each lecture each student must submit to me at least two thought-provoking questions on the main paper for that week. These questions should critically evaluate the paper (eg, questioning the assumptions). At the end of the semester, each student must write a 4-pages long position paper about one of the topics that has been discussed in class. This can be about the topic the student has presented, or about any other topic that has been discussed in class. This is intended to be an interactive class, and as such, class participation will play a significant role in the grading criteria. Students will be graded on the presentation and analysis of their assigned paper, their participation in discussions and questions.

Onderwijsvorm
Seminar, active participation

Toetsvorm
Presentations, participation at seminar, and a 4-page position paper. You will be graded with respect to your presentation, your position paper, and your active participation to the seminar. Each of these aspects will account for 1/3 of the final grade. Important: you have to get at least 6 in all the 3 aspects to be able to pass the exam.

Literatuur
A selection of papers.

Vereiste voorkennis
The class is restricted only to PDCS students so that individual guidance can be offered.

Doelgroep
This course is only accessible for mPDCS students.
Advanced Topics in Distributed Systems

**Doel vak**
Discuss advanced topics relevant for traditional and modern distributed systems.

**Inhoud vak**
The course takes the form of a seminar that is based on a selection of papers that either have had a strong impact on distributed systems today, or explore novel ideas that may be important in the future. Subjects will cover important aspects of distributed systems such as communication, data consistency, replication, fault tolerance, performance, scalability, etc. Also, modern distributed systems such as next-generation Web-based systems and wireless sensor networks will have their place. For this seminar we expect the students to actively participate by means of presentations and discussions. Papers for discussions will be selected from the base set, with possibly 1 or 2 added where appropriate.

**Onderwijsvorm**
Seminar.

**Toetsvorm**
Presentations, participation at seminar, and a 4-page position paper.

**Literatuur**
A (selection of a) list of papers, yet to be decided.

**Vereiste voorkennis**
Distributed Systems (400130).

**Doelgroep**
mPDCS

**Overige informatie**
This course is only accessible for mPDCS students. More information about this course is available at http://www.cs.vu.nl/~gpierre/courses/atds/
Doel vak
Deepening insights in static and dynamic analysis, applied to binaries and malware

Inhoud vak
Binaries in general, and malware in particular, are very hard to analyse. Unlike with source code, you have no idea what the binary does, or even what the data structures look like - let alone what they mean!. Security analysts, forensic experts, and reverse engineers often have to dig their way through such programs to figure out what the code is all about, and where the interesting pieces of information are.

How do they do this? What techniques and tools can they fall back on, and, conversely, what techniques do the malware authors use to prevent this?

This is a (tough) hands-on specialisation course for a small group of motivated students, who will learn essential analysis techniques and methods in both static and dynamic analysis. Not only will they pick apart real malware, they will also be working on a set of cool and very complicated challenges to find a secret buried deep inside a binary program.

For static analysis, we will look in depth at the generation of control flow graphs, and complications that may arise due to indirect calls and jumps (as well as deliberate obfuscation). For dynamic analysis, we will look at data and control flow tracking (dynamic information flow tracking)

Binary patching will be used to circumvent the binary's defenses. To do so, students need to know details about popular binary formats (ELF, PE, etc.), and work with all manner of state-of-art system tools to analyse the binaries (think IDA Pro, OllyDbg, taint analysis tools, etc.).

In addition, students will be exposed to programs that actively fight static and dynamic analysis.

Doel vak
Students shall both explore the area of Cluster and Grid Computing and develop their skills in critical assessment of scientific literature.

Inhoud vak
Both Cluster and Grid computing are areas of rapid technical developments. Many technical developments are still in flux. We investigate resource management and scheduling, remote data access, network and other performance issues, as well as software architecture and programming models for grids.

Onderwijsvorm
Introductory lecture, followed by a seminar part and practical programming assignments. In the seminar part, students explore topic areas of Cluster and Grid Computing in small groups, present their findings in a presentation session and prepare a report. The practical programming assignments are to be addressed individually.

Toetsvorm
Both parts contribute 50% to the grade:
(i) seminar presentation and report
(ii) programming assignments

Literatuur
Various research articles as available online.

Vereiste voorkennis
Parallel Programming (code 400161)

Doelgroep
mCS-FMSV, mCS-HPDC, mCS-IWT, mCS-MM, mCS-SE, mCS-TAI, mPDCS

Overige informatie
Participation in the course is limited; priority is given to students of the M.Sc. programme in Parallel and Distributed Computer Systems (mPDCS), and to students following the HPDC specialization of the M.Sc. in Computer Science (mCS-HPDC).
Coding and Cryptography

Doel vak
To give an introduction the theory of error correcting codes and to cryptography.

Inhoud vak
This course provides a thorough introduction to the theory of error correcting codes, and to cryptography. It is aimed especially at students of Computer Science. For error correcting codes we shall include cyclic codes, BCH codes, Reed-Solomon codes and burst error correction. For cryptography we discuss some modern public key cryptography (e.g., RSA, ElGamal, DSA).

Onderwijsvorm
Lectures and exercise classes

Toetsvorm
Written exam and homework

Literatuur
We shall be working from "Coding theory and cryptography, the essentials" by Hankerson, Hoffman, Leonard, Lindner, Phelps, Rodger and Wall (second edition, revised and expanded).

Aanbevolen voorkennis
"Algebra en Discrete Wiskunde 1", "Inleiding Codering en Discrete Wiskunde", or equivalent.

Doelgroep
mAI-CIS, mAI-TAI, mCS-FMSV, mCS-HPDC, mCS-IWT, mCS-MM, mCS-SE, mCS-TAI, mMath, mPDCS

**Doel vak**
After taking this course, you will be able to:

- understand to a large extent the intricacies related to designing and developing a distributed computer system.
- understand the tradeoffs between centralized, distributed, and fully decentralized solutions.
- be capable of successfully studying research papers on (advanced) distributed systems.

**Inhoud vak**
It is difficult to imagine a standalone modern computer system: every such system is one way or the other connected through a communication network with other computer systems. A collection of networked computer systems is generally referred to as a distributed (computer) system. As with any computer system, we expect a distributed system to simply work, and often even behave as if it were a single computer system. In other words, we would generally like to see all the issues
related to the fact that data, processes, and control are actually
distributed across a network hidden behind well-defined and properly
implemented interfaces. Unfortunately, life is not that easy.

As it turns out, distributed systems time and again exhibit emergent
behavior that is difficult to understand by simply looking at
individual components. In fact, many aspects of a distributed system
cannot even be confined to a few components, as is easily seen by just
considering security.

In this course, we pay attention to the pillars on which modern
distributed systems are built. Unfortunately, these pillars cannot be
viewed independently from each other: each one is equally important
for understanding why a distributed system behaves the way it does,
and depends on the way that other pillars have been constructed. In
this sense, pillars form principles, in turn offering a view that one
can take when studying distributed systems. We will consider the
following principles:

- architectures
- processes
- communication
- naming
- coordination
- consistency and replication
- fault tolerance
- security

These principles will be discussed in the context of a few simplifying
concepts that have been used to master the complexity of developing
distributed systems: objects, files, documents, and events.

**Onderwijsvorm**
The course is taught as a series of lectures.

**Toetsvorm**
There is a written exam.

**Literatuur**
Andrew S. Tanenbaum, Maarten van Steen, "Distributed Systems,

**Vereiste voorkennis**
Students should have taken a standard course on computer
networks. Experience with (distributed) programming will be helpful.

**Doelgroep**
mCS, PDCS, mAI, mIS

</tbody>
</table>
**Doel vak**
To learn about computational methods based on Darwinian principles of evolution. To illustrate the usage of such methods as problem solvers and as simulation, respectively modelling tools. To gain hands-on experience in performing experiments.

**Inhoud vak**
The course is treating various algorithms based on the Darwinian evolution theory. Driven by natural selection (survival of the fittest), an evolution process is being emulated and solutions for a given problem are being "bred". During this course all "dialects" within evolutionary computing are treated (genetic algorithms, evolutiestrategieën, evolutionary programming, genetic programming, and classifier systems). Applications in optimisation, constraint handling and machine learning are discussed. Specific subjects handled include: various genetic structures (representations), selection techniques, sexual and asexual genetic operators, (self-)adaptivity. If time permits, subjects in Artificial Life and Artificial Societies, and Evolutionary Art will be handled. Hands-on-experience is gained by a compulsory programming assignment.

**Onderwijsvorm**
Oral lectures and compulsory programming assignment.

**Toetsvorm**
Written exam and programming assignment (weighted average).

**Doel vak**
Deepening insights by applying study contents in an industrial setting.
Inhoud vak
Individual project work by which the student applies the study contents in an industrial setting. Before the start of the internship, the student has to get approval for the internship project by a VU (Computer Science) lecturer. The project has to focus on research or development aspects, by which the student can apply and validate the study contents within the specific constraints of an industrial setting. At the end of the internship, the student submits a written report to the lecturer, in which the work, the lessons learned, and the insights from applying study contents in an industrial setting are described.

Doel vak
Guide the student through the design and development of Network and Web applications.

Inhoud vak
The course discusses the principles for understanding, designing, and developing Internet applications. This includes programming the network (sockets, threads, RPC, RMI), programming the web interface (servlets, PHP, Javascript, AJAX), and setting up secure communication channels. Throughout the course, as well as in the context of the lab assignments, attention is paid to practical issues of applying these concepts.

Onderwijsvorm
Lectures combined with lab assignments

Toetsvorm
Final exam plus lab assignments

Doel vak
Introduction to the proof assistant Coq and its foundations

Inhoud vak
A proof-assistant is used to check the correctness of a specification of a program or the proof of a theorem. The course is concerned with the proof-assistant Coq which is based on typed lambda calculus. In the practical work, we learn to use Coq. One of the exercises is concerned with the correctness proof of the specification of a sorting algorithm, from which a functional program is extracted. In the course, we focus on the Curry-Howard-De Bruijn isomorphism between proofs on the one hand and lambda-terms (which can be seen as functional programs) on the other hand. This is the basis of proof-assistants like Coq. We study various typed lambda calculi and the corresponding logics.

Onderwijsvorm
2 hours theory class, 2 hours practical work

Toetsvorm
Written exam and obligatory Coq exercises

Literatuur
Course notes

Vereiste voorkennis
An introduction course in logic.

Doelgroep

Master Project

**Doel vak**
With the Master project, the student is to demonstrate the ability to integrate knowledge, insights, and skills gained so far in the Master programme, and to apply them to a new or otherwise unknown subject.

**Inhoud vak**
The student is offered a research question that needs to be answered following a systematic approach. This approach includes steps such as exploring relevant literature, and will, in general, consist of setting up and carrying out experiments by means of simulations, emulations, or actual systems software. The results and findings will be described in a thesis conforming to the academic standards in the field. An oral presentation of the project results concludes the project.

**Toetsvorm**
The grade will be determined based on written thesis and oral presentation.

**Doel vak**
Gain practical experience with the contents of the Operating Systems course.
Inhoud vak
This practical is divided into two separate exercises, each adding functionality to a different part of the MINIX 3 operating system. Both exercises are required to pass the class. The first exercise adds kernel functionality (process profiling), the second one adds file system functionality (defragmentation). Together, these courses cover a significant part of the content of the Operating Systems course.

Onderwijsvorm
Practical computer work

Toetsvorm
Practical computer work.

Aanbevolen voorkennis
Mandatory: Operating Systems (400011)

Doelgroep
mCS-FMSV, mCS-HPDC, mCS-IWT, mPDCS

Overige informatie
Assignments can be submitted until the end of August, although the assistants may not be available during this two-month grace period. The course is based on MINIX version 3.1.0, that is, the version described in the third edition of the "Operating Systems Design and Implementation" book by Tanenbaum and Woodhull. Students who have not taken the "bedrijfssystemen" or "operating systems" course at the VU are strongly advised to follow the Operating Systems course or study the internals of MINIX 3 in detail before the start of the course. All information about the course is available online at http://www.cs.vu.nl/~bs/.

Inhoud vak
This lecture discusses how programs can be written that run in parallel on a large number of processors, with the goal of reducing execution time. The class has a brief introduction into parallel computing systems (architectures). The focus of the class, however, is on programming methods, languages, and applications. Both traditional techniques (like message passing) and more advanced techniques (like parallel object-oriented languages) will be discussed. Several parallel applications are discussed, including N-body simulations and search algorithms. About 4-5 lectures are devoted to an important new development: programming many-core machines such as Graphical Processing Units (GPUs). The class fits
well with existing research projects within the department of Computing Systems. It is a good basis for M.Sc. projects in the area of parallel programming, which use the parallel computing systems of the department.

**Onderwijsvorm**
Class with separate practicum (6 ECTS).

**Toetsvorm**
Written exam.

**Literatuur**
To be announced.

**Vereiste voorkennis**
Knowledge about the first part of the class Parallel Programming is recommended (introduction into parallel programming, MPI, and Java).

**Inhoud vak**
With this practicum, several parallel programs have to be written, using different programming environments, including Java, MPI, and CUDA/OpenCL (for GPUs). The programs must be tested on a parallel machine of the faculty (see [http://www.cs.vu.nl/das3](http://www.cs.vu.nl/das3)) and the performance (speedups) of the programs must be measured, analyzed, and, whenever necessary, optimized. A brief report must be written that explains the approach and discusses the measurements.

### PDCS Programming Project
PDCS programming projects can be taken instead of other practical courses. They are often related to existing research programs in computer systems. There is no set course description as each project is negotiated individually with the professor supervising and grading it. The assignment aims to offer students challenging projects that are often research-oriented by nature. Students are strongly advised to talk to staff members individually to see whether they have a project that matches the student's interest, as well as the capacity to supervise such a project.

**Doelvak**

mPDCS

**Overige informatie**

Various lecturers

**Protocol Validation**

Learning to use formal techniques for specification and validation of communication protocols.

**Inhoud vak**

This course is concerned with the specification and validation of protocols, using formal methods. The course is based on a specification language based on process algebra combined with abstract data types, called mCRL. This language and its toolset can be used for the specification of parallel, communicating processes with data. Model checking is a method for expressing properties of concurrent finite-state systems, which can be checked automatically. Interesting properties of a specification are: "something bad will never happen" (safety), and "something good will eventually happen" (liveness). In the lab we will teach the use of a tool for automated verification of the required properties of a specification.
Onderwijsvorm
4 hours per week HC
4 hours per week WC/PR (mixed)

During the practicum the mCRL tool and the CADP model checker will be used for the validation of protocols discussed during lectures.

Toetsvorm
Written exam, together with a practical homework assignment. The overall mark of the course is (H+2W)/3, where H is the mark for the homework assignment, and W is the mark for the written exam.

Doel vak
The aim of this course is to learn to read papers at a research level, organize the material for the framework of a seminar talk, and practice presentation skills for such talk. At the end of this course, the student will be able to acquire the prerequisites for reading and understanding a paper by researching the literature on his own, understand the logic of a paper, and be able to critically evaluate a paper. He or she will be able to extract and condense the material for a talk of a fixed length, and give a captivating and interesting talk to fellow students.

Inhoud vak
This course has the single main aim to teach students the first steps of writing a research proposal. Students are asked to evaluate a number of existing proposals that were submitted by staff members in recent years. In addition, each student will also have to write his or her own proposal, which is then evaluated by fellow students following a procedure very similar to what happens in real life. This class may only be attended by PDCS students.

</tr>
</tbody>
</table>

Doel vak
The aim of this course is to provide the writing student with the essential linguistic means for producing English academic texts which are effective, idiomatically and stylistically appropriate and grammatically correct.

Inhoud vak
The initial focus in the course lies on the form of scientific texts in the Exact Sciences:
• Abstract (or summary)
• Introduction
• Methods
• Results
• Discussion

General course outline
Introducing the topics
- Academic and technical writing in English
- The characteristics of different kinds of scientific texts
- How scientific writing is judged and assessed
- Where do you find your information and how do you present it?
- How to avoid committing plagiarism
Who am I writing for? What do I want to say?
- Your readership
- Key parts of an academic article: title, abstract, introduction, methods, results and discussion
Writing the actual article
- Paragraph and sentence construction: how do I link paragraphs together?
- Writing simple and complex sentences. Active and passive sentences.
- Argumentation: how do I put an argument? How do I frame my own opinion?
Should I use “I” or “we”?
Writing correct English
- Use of apostrophes and colons
- Word order, verb tenses, time and tense
- Avoiding mistakes typically made by Dutch writers
- Common spelling mistakes

You will be making considerable use of peer assessment: examining fellow students’ written work and giving them feedback. This method provides useful insights into how a text might be improved. The process of providing someone else with feedback on their text is something that you will find very instructive.

**Onderwijsvorm**
The course is focused on self-tuition. The plenary sessions concentrate on the process of writing and the product of writing. Homework is part of the course. With each topic, participants work through a phased series of exercises that usually conclude with the requirement to write a short piece of text. The instructor will append extensive written remarks to this text.

**Toetsvorm**
There will be no examination. However, students will receive their credits only when they have participated in all classes (presence is obligatory) and also when they have handed in the assignments satisfactorily. Students will receive a ‘pass’ when they have finished the course.

**Literatuur**
For this course you need the book Effective Scientific Writing: an advanced learner’s guide to better English (A. Bolt & W. Bruins, ISBN 978 90 8659 6171). This book can be obtained at the VU bookstore, which is located in the VU main building. The costs are € 27,95 per book. For questions contact the Taalcentrum-VU at 020 - 598 9804.

**Vereiste voorkennis**

**Doel vak**
Learning the fundamental notions of term rewriting and getting acquainted with some more advanced topics in the field

**Inhoud vak**
Term rewriting systems (TRSs) provide for a natural formalism for specifying rules of computation and investigating their properties. TRSs are of basic importance for functional programming and for the implementation of abstract data types. Applications can also be found in theorem proving, proof checking and logic programming. Some topics that will be covered in the course are:
- abstract reduction systems;
- critical pairs and Knuth-Bendix completion;
- orthogonality and reduction strategies;
- termination (rpo's, monotone algebras);
- combinatoric logic;
- decidability issues;
- infinitary rewriting.
Onderwijsvorm
Lectures and practice sessions.

Toetsvorm
Written examination.

Literatuur
Course notes will be provided.
