This master’s programme emphasizes experimental computer science, rather than theory, and typically requires
design, implementation, testing, and performance analysis of software for advanced parallel and distributed systems.
It contains a balance between classes and practical work: about one third of the first three semesters consists of
practical projects. The final semester is a master’s thesis, which will usually involve doing research in conjunction with
one of the faculty members. In contrast to other master’s programmes, PDCS requires that students explicitly apply to
be admitted. Up-to-date information can be found at the FEW-website.

Limited offered course

This course is taught this year only at our University. Philippe Kruchten is Professor of Software Engineering at the University of British Columbia in Vancouver. He is world-famous as the chief designer of the Rational Unified Process (RUP) and currently he is doing research on Agile Architectures. He will give this course specially for our Master Computer Science and Master Information Sciences students.

Advanced Logic

Doel vak
The objective is to obtain a good understanding of modal logic and its use in computer science and artificial intelligence.

Inhoud vak
A thorough introduction to modal logics, and its applications in computer science and artificial intelligence. We will select some themes from the book Modal Logics for Open Minds, by Johan van Benthem: basic modal logic and possible world semantics, bisimulation and invariance, modal definability, decidability, ... In particular we treat the modal logics most relevant to computer science and AI: temporal, dynamic and epistemic logic.

Onderwijsvorm
Weekly 2 lectures and 1 exercise class, for the duration of 7 weeks.

Toetsvorm
A written exam and assignments that can make half a point bonus.

Literatuur
Johan van Benthem, Modal Logics for Open Minds, CSLI Publications 2010.

Aanbevolen voorkennis
The bachelor course Logica en Modelleren (previously Inleiding Logica), or an equivalent introduction to first-order logic.

Doelgroep
mAI, mCS, mPDCS

Advanced Topics in Computer and Network Security

Vrije Universiteit Amsterdam · Faculteit der Exacte Wetenschappen · M Parallel and Distributed Computer Syst · 2015-2016
Doel vak
The goal of this course is for students to develop an in-depth understanding of classical and recent research in system and network security, and practice their presentation and argumentation skills. The class is restricted only to PDCS students so that individual guidance can be offered.

Inhoud vak
The course takes the form of seminars based on a selection of papers that either have had a strong impact on security today, or explore novel ideas that may be important in the future. Students are required to read all papers assigned during the semester and be able to competently discuss the material in class. Each student will be responsible for presenting one lecture -- that lecture will be based on the assigned paper for the week including as much relevant related work as necessary to distill the work presented in the paper. The speaker will have 25 minutes talk to present the papers she read. The presentation will be followed by 20 minutes of interactive discussion in the class. Before each lecture each student must submit to me at least two thought-provoking questions on the main paper for that week. These questions should critically evaluate the paper (eg, questioning the assumptions). At the end of the semester, each student must write a 4-pages long position paper about one of the topics that has been discussed in class. This can be about the topic the student has presented, or about any other topic that has been discussed in class. This is intended to be an interactive class, and as such, class participation will play a significant role in the grading criteria. Students will be graded on the presentation and analysis of their assigned paper, their participation in discussions and questions.

Onderwijsvorm
Seminar, active participation

Toetsvorm
Presentations, participation at seminar, and a 4-page position paper. You will be graded with respect to your presentation, your position paper, and your active participation to the seminar. Each of these aspects will account for 1/3 of the final grade. Important: you have to get at least 6 in all the 3 aspects to be able to pass the exam.

Literatuur
A selection of papers.

Doelgroep
This course is restricted to mPDCS students so that individual guidance can be offered.

Advanced Topics in Distributed Systems
**Doel vak**
Discuss advanced topics relevant for traditional and modern distributed systems.

**Inhoud vak**
The course takes the form of a seminar that is based on a selection of papers that either have had a strong impact on distributed systems today, or explore novel ideas that may be important in the future. Subjects will cover important aspects of distributed systems such as communication, data consistency, replication, fault; tolerance, performance, scalability, etc. Also, modern distributed systems such as next-generation Web-based systems and wireless sensor networks will have their place. For this seminar we expect the students to actively participate by means of presentations and discussions. Papers for discussions will be selected from the base set, with possibly 1 or 2 added where appropriate.

**Onderwijsvorm**
Seminar.

**Toetsvorm**
Presentations, participation at seminar, and a 4-page position paper.

**Literatuur**
A (selection of a) list of papers, yet to be decided.

**Vereiste voorkennis**
Distributed Systems (400130).

**Doelgroep**

Doel vak
Deepening insights in static and dynamic analysis, applied to binaries and malware

Inhoud vak
Binaries in general, and malware in particular, are very hard to analyse. Unlike with source code, you have no idea what the binary does, or even what the data structures look like - let alone what they mean!. Security analysts, forensic experts, and reverse engineers often have to dig their way through such programs to figure out what the code is all about, and where the interesting pieces of information are.

How do they do this? What techniques and tools can they fall back on, and, conversely, what techniques do the malware authors use to prevent this?

This is a (tough) hands-on specialisation course for a small group of motivated students, who will learn essential analysis techniques and methods in both static and dynamic analysis. Not only will they pick apart real malware, they will also be working on a set of cool and very complicated challenges to find a secret buried deep inside a binary program.

For static analysis, we will look in depth at the generation of control flow graphs, and complications that may arise due to indirect calls and jumps (as well as deliberate obfuscation). For dynamic analysis, we will look at data and control flow tracking (dynamic information flow tracking)

Binary patching will be used to circumvent the binary's defenses. To do so, students need to know details about popular binary formats (ELF, PE, etc.), and work with all manner of state-of-art system tools to analyse the binaries (think IDA Pro, OllyDbg, taint analysis tools, etc.).

In addition, students will be exposed to programs that actively fight static and dynamic analysis.

Onderwijsvorm
Hoorcollege and practical

Literatuur
Slides and online material

Doelgroep
mCS-HPDC, mCS-IWT, mPDCS

Coding and Cryptography
Doel vak
To give an introduction the theory of error correcting codes and to cryptography.

Inhoud vak
This course provides a thorough introduction to the theory of error correcting codes, and to cryptography. It is aimed especially at students of Computer Science. For error correcting codes we shall include cyclic codes, BCH codes, Reed-Solomon codes and burst error correction. For cryptography we discuss some modern public key cryptography (e.g., RSA, ElGamal, DSA).

Onderwijsvorm
Lectures and exercise classes

Toetsvorm
Written exam and homework. The written exam will count for 80 percent of the grade, the homework will count for 20 percent of the grade. If not both the written exam and the homework are at least 55 percent each, then the maximum score will be 54 percent (which constitutes a fail).

Literatuur
We shall be working from "Coding theory and cryptography, the essentials" by Hankerson, Hoffman, Leonard, Lindner, Phelps, Rodger and Wall (second edition, revised and expanded).

Aanbevolen voorkennis
Some knowledge on linear algebra, on the integers modulo n, and on polynomials.

Doelgroep
mAI, mCS, mMath, mPDCS

Computer Networks Practical
Doel vak
Put concepts of Computer Networks and Operating Systems into practice, in the context of smartphones.

Inhoud vak
This is a (tough) lab course, that involves low-level programming on Android smartphones. It requires very thorough understanding of operating systems and network concepts. It is done either individually or in groups of two.

Onderwijsvorm
Practical computer work

Toetsvorm
Practical computer work

Aanbevolen voorkennis
Computer Networks (X_400487)
Operating Systems (X_400011)
Good knowledge of Java!

Doelgroep
mCS, mPDCS

Doel vak
This course provides a comprehensive presentation of the foundations and programming principles for multicore computing devices.

Learning objectives are: fundamental insight into multicore computing; algorithms for multicore computing; analyzing such algorithms; concurrent datastructures; multicore programming.

Inhoud vak
Shared memory, mutual exclusion, synchronization operations, concurrent data structures, scheduling, transactional memory, multithreaded programming assignment.

Onderwijsvorm
Lectures: 4 hours per week, exercise classes: 4 hours per week.
**Toetsvorm**
Written exam (which counts for 70% of the final mark) and one
programming assignment (which counts for 30% of the final mark).

**Literatuur**

**Overige informatie**
The homepage of the course is at [http://www.cs.vu.nl/~tcs/cm/](http://www.cs.vu.nl/~tcs/cm/)

The lectures and written exam of the BSc and MSc variant of Concurrency
and Multithreading coincide. The difference is that the BSc variant has
a smaller programming assignment than the MSc variant.

The MSc variant of this course cannot be followed by students that
included the BSc variant in their BSc program.

**Concurrency Theory**

**Doel vak**
To obtain a good understanding of concurrency concepts and a large range of distributed algorithms.

To offer a bird's-eye view on a wide range of algorithms for basic challenges in distributed systems.

To provide students with an algorithmic frame of mind for solving fundamental problems in distributed computing.

**Inhoud vak**
Snapshots, graph traversal, termination detection, garbage collection, deadlock detection, routing, election, minimal spanning trees, anonymous networks, fault tolerance, failure detection, synchronization, consensus, mutual exclusion, self-stabilization.

Characteristic of the course is that correctness arguments and complexity calculations of distributed algorithms are provided in an intuitive fashion.

**Onderwijsvorm**
4 hours per week HC
4 hours per week WC

**Toetsvorm**
Written examen (plus a take-home exercise sheet that can provide up to 0.5 bonus point).

**Doelgroep**
mAI, mCS, mPDCS

**Overige informatie**

**Distributed Systems**
Doel vak
After taking this course, students will be able to:

- understand to a large extent the intricacies related to designing and developing a distributed computer system.
- understand the tradeoffs between centralized, distributed, and fully decentralized solutions.
- be capable of successfully studying research papers on (advanced) distributed systems.

Inhoud vak
It is difficult to imagine a standalone modern computer system: every such system is one way or the other connected through a communication network with other computer systems. A collection of networked computer systems is generally referred to as a distributed (computer) system. As with any computer system, we expect a distributed system to simply work, and often even behave as if it were a single computer system. In other words, we would generally like to see all the issues related to the fact that data, processes, and control are actually distributed across a network hidden behind well-defined and properly implemented interfaces. Unfortunately, life is not that easy.

As it turns out, distributed systems time and again exhibit emergent behavior that is difficult to understand by simply looking at individual components. In fact, many aspects of a distributed system cannot even be confined to a few components, as is easily seen by just considering security.

In this course, we pay attention to the pillars on which modern distributed systems are built. Unfortunately, these pillars cannot be viewed independently from each other: each one is equally important for understanding why a distributed system behaves the way it does, and depends on the way that other pillars have been constructed. In this sense, pillars form principles, in turn offering a view that one can take when studying distributed systems. We will consider the following principles:

- architectures
- processes
- communication
- naming
- coordination
- consistency and replication
- fault tolerance

These principles will be discussed in the context of a few simplifying concepts that have been used to master the complexity of developing distributed systems: objects, files, documents, and events.

Onderwijsvorm
The course is taught as a series of lectures, in combination with small exercises.
Toetsvorm
Written exam.

Literatuur
This year, we will use a reader. Details about its distribution will be announced via blackboard in due time.

Vereiste voorkennis
Students should have taken a standard course on computer networks. Experience with (distributed) programming will be helpful.

Doel vak
To learn about computational methods based on Darwinian principles of evolution. To illustrate the usage of such methods as problem solvers and as simulation, respectively modelling tools. To gain hands-on experience in performing experiments.

Inhoud vak
The course is treating various algorithms based on the Darwinian evolution theory. Driven by natural selection (survival of the fittest), an evolution process is being emulated and solutions for a given problem are being "bred". During this course all "dialects" within evolutionary computing are treated (genetic algorithms, evolutiestrategieën, evolutionary programming, genetic programming, and classifier systems). Applications in optimisation, constraint handling, machine learning, and robotics are discussed. Specific subjects handled include: various genetic structures (representations), selection techniques, sexual and asexual variation operators, (self-)adaptivity. Special attention is paid to methodological aspects, such as algorithm design and tuning. If time permits, subjects in Artificial Life will be handled. Hands-on-experience is gained by a compulsory programming assignment.

Onderwijsvorm
Oral lectures and compulsory programming assignment. Highly motivated students can replace the programming assignment by a special research track under the personal supervision of the lecturer(s).
Toetsvorm
Written exam and programming assignment (weighted average).

Doel vak
Learn the basics of empirical experimentation in the field of Software Engineering.
Be able to operate in a lab environment and build a successful experiment for software energy consumption.
Become familiar with the research problems in the field of green software engineering.
Understand and measure the impact of software over energy consumption.

Inhoud vak
Students will work in teams to perform experiments on software energy consumption in a controlled environment. They will have to carry out all the phases of empirical experimentation, from experiment design to operation, data analysis and reporting. They will be provided with examples of previous experiments, but they will have to choose by themselves the experimental subjects and hypotheses to test. During the lab sessions, students will be assisted for technical operation of the lab equipment as regards measurement and data gathering. Students will also receive the required training for data analysis and visualization (i.e. graphs, dashboards) using specialized software.

Onderwijsvorm
Lectures. Lab sessions.

Toetsvorm
Teamwork, project assignments.

Literatuur
Aanbevolen voorkennis
Basic statistical analysis techniques (descriptive statistics and most common tests).

Doel vak
Deepening insights by applying study contents in an industrial setting

Inhoud vak
Individual project work by which the student applies the study contents in an industrial setting. Before the start of the internship, the student has to get approval for the internship project by a VU Computer Science lecturer. The project has to focus on research or development aspects, by which the student can apply and validate the study contents within the specific constraints of an industrial setting. At the end of the internship, the student submits a written report to the lecturer, in which the work, the lessons learned, and the insights from applying study contents in an industrial setting are described.

For the grading of the report, most important are the student's reflections on study contents vs. "industrial reality": What did you learn during your studies that was particularly helpful for your internship? What is different in an industrial environment, compared to university? What did you learn during your internship that you were not told at university?

Onderwijsvorm
individual project work in an industrial setting

Toetsvorm
written report

Aanbevolen voorkennis
The student should have completed at least 48 credits of his or her Master programme such that there are sufficient study contents to be applied in an industrial setting.
**Doel vak**
Guide the student through the design and development of Network and Web applications.

**Inhoud vak**
The course discusses the principles for understanding, designing, and developing Internet applications. This includes programming the network (sockets, threads, RPC, RMI), programming the web interface (servlets, PHP, Javascript, AJAX), and setting up secure communication channels. Throughout the course, as well as in the context of the lab assignments, attention is paid to practical issues of applying these concepts.

**Onderwijsvorm**
Lectures combined with lab assignments

**Toetsvorm**
Final exam plus lab assignments

**Literatuur**
Course slides

**Vereiste voorkennis**
Knowledge of C, Java

**Aanbevolen voorkennis**
Good knowledge of both C and Java

**Doelgroep**
mAI, mCS, mPDCS

**Large-Scale Computing Infrastructures**

Doel vak
Students explore the field of large-scale computing infrastructures. They study its technological frontiers from scientific publications and get hands-on experience via programming assignments.

Inhoud vak
Cloud infrastructures like Amazon's EC2 or Microsoft's Azure provide seemingly limitless compute and storage capacity. The technology underlying these systems strongly relies on decades of work on high-performance, distributed computing platforms, such as cluster computing, computing grids, and supercomputers. We study aspects of computing in large scale, such as resource management and scheduling, remote data access, energy efficiency, failure resilience, performance of large systems, as well as suitable software architecture and programming models such as MapReduce.

Onderwijsvorm
Introductory lectures, followed by a seminar part and practical programming assignments. In the seminar part, students explore the technological frontiers of large-scale computing, published in top-quality scientific venues of the field. Students present their findings and write position papers about topics presented by other students in the class. With the practical programming assignments, students get hands-on experience with large-scale computing infrastructures.

Toetsvorm
Both parts contribute 50% each to the grade:
- seminar presentation and position paper
- programming assignments

Literatuur
Various scientific articles as available online

Aanbevolen voorkennis
Students should have basic knowledge about distributed systems and parallel application programming.
Students must be able to program in Java and Python (or be able to get the needed skills on the fly).

Doelgroep
mPDCS, mCS

Logical Verification

Vakcode
X_400115 (400115)
**Doel vak**
Introduction to the proof assistant Coq and its type-theoretic foundations.

**Inhoud vak**
A proof-assistant is used to check the correctness of a specification of a program or the proof of a theorem. The course is concerned with the proof-assistant Coq which is based on typed lambda-calculus. In the practical work, we learn to use Coq. One of the exercises is concerned with the correctness proof of the specification of a sorting algorithm, from which a functional program is extracted. In the course, we focus on the Curry-Howard-De Bruijn isomorphism between proofs on the one hand and lambda-terms (which can be seen as functional programs) on the other hand. This is the basis of proof-assistants like Coq. We study various typed lambda calculi and the corresponding logics.

**Onderwijsvorm**
2 times 2 hours theory class, 2 times 2 hours practical work

**Toetsvorm**
Written exam, obligatory Coq-exercises, obligatory hand-in theory exercises.

**Literatuur**
Course notes

**Vereiste voorkennis**
An introduction course in logic.

**Doelgroep**
mCS, mAI, mMath, mPDCS

**Overige informatie**
The course is taught once every two years, the next opportunity will be in study year 2016-2017

Doel vak
With the Master project, the student is to demonstrate the ability to integrate knowledge, insights, and skills gained so far in the Master programme, and to apply them to a new or otherwise unknown subject.

Inhoud vak
The student is offered a research question that needs to be answered following a systematic approach. This approach includes steps such as exploring relevant literature, and will, in general, consist of setting up and carrying out experiments by means of simulations, emulations, or actual systems software. The results and findings will be described in a thesis conforming to the academic standards in the field. An oral presentation of the project results concludes the project.

Toetsvorm
The grade will be determined based on the quality of the performed project work, a written thesis, and an oral presentation.

Aanbevolen voorkennis
The student must have completed (almost) the complete study program before starting the Master Project.

Doel vak
Gain practical experience with the contents of the Operating Systems course.

Inhoud vak
This practical is divided into two separate exercises, each adding functionality to a different part of the MINIX 3 operating system. Both exercises are required to pass the class. The first exercise adds kernel functionality (process profiling), the second one adds file system
functionality (defragmentation). Together, these courses cover a
significant part of the content of the Operating Systems course.

Doel vak
You will learn
- the backgrounds of High Performance Computing (HPC)
- apply design methods for parallel algorithms
- compare different parallel computer architectures
- analyze performance of network topologies
- compare different parallel programming constructs and programming environments
- get insight in some selected parallel applications
- understand many-cores (e.g. GPUs), many-core algorithms, many-core optimizations

Inhoud vak
This lecture discusses how programs can be written that run in parallel
on a large number of processors, with the goal of reducing execution
time. The class has a brief introduction into parallel computing systems
(architectures). The focus of the class, however, is on programming
methods, languages, and applications. Both traditional techniques (like
message passing) and more advanced techniques (like parallel object-
oriented languages) will be discussed. Several parallel applications are
discussed, including N-body simulations and search algorithms. About 4
lectures are devoted to an important new development: programming many-
core machines such as Graphical Processing Units (GPUs). The class fits
well with existing research projects within the department of Computing
Systems. It is a good basis for M.Sc. projects in the area of parallel
programming, which use the parallel computing systems of the department.
Onderwijsvorm
Lectures (4 hours per week), given by prof.dr.ir. Henri Bal (VU) and dr. Ana Varbanescu (UvA). There is a separate Parallel Programming Practicum (6 ECTS).

Toetsvorm
Written exam.

Literatuur
To be announced.

Inhoud vak
With this practicum, several parallel programs have to be written, using different programming environments, including Java, MPI, and CUDA/OpenCL (for GPUs). The programs must be tested on a parallel machine of the faculty (see http://www.cs.vu.nl/das4) and the performance (speedups) of the programs must be measured, analyzed, and, whenever necessary, optimized. A brief report must be written that explains the approach and discusses the measurements.

Onderwijsvorm
Practical computer work.

Toetsvorm
Practical computer work.

Vereiste voorkennis
Knowledge of parallel programming in Java, MPI, and CUDA/OpenCL (as taught in the Parallel Programming course) is required.

Doelgroep
Masters Computer Science, PDCS, AI, and Computational Science

Overige informatie
Students can do this course either in Period 2 or in Period 3. It is not possible to submit assignments in both periods.
PDCS Programming Project

**Doel vak**
Let the student get hands-on experience with developing systems-level software in the context of ongoing research projects.

**Inhoud vak**
PDCS programming projects can be taken instead of other practical courses. They are often related to existing research programs in computer systems. There is no set course description as each project is negotiated individually with the professor supervising and grading it. The assignment aims to offer students challenging projects that are often research-oriented by nature. Students are strongly advised to talk to staff members individually to see whether they have a project that matches the student's interest, as well as the capacity to supervise such a project.

**Onderwijsvorm**
Individual programming project

**Toetsvorm**
To be decided by the supervisor.

Vrije Universiteit Amsterdam - Faculteit der Exacte Wetenschappen - M Parallel and Distributed Computer Syst - 2015-2016
Doel vak
Students will acquire basic knowledge of:
• performance aspects of networked systems, consisting of servers, services, and clients
• performance engineering principles and methods,
• quantitative models for predicting and optimizing the performance of networked systems,
• quantitative models for planning capacity of networked systems.
Students will gain experience in engineering and planning performance of networked systems, and will learn how to tackle practical performance problems arising in the ICT industry.

Inhoud vak
Over the past few decades, information and communication technology (ICT) has become ubiquitous and globally interconnected. As a consequence, our information and communication systems are expected to process huge amounts of (digital) information, which puts a tremendous burden on our ICT infrastructure. At the same time, our modern society has become largely dependent on the well-functioning of our ICT systems; large-scale system failures and perceivable Quality of Service (QoS) degradation may completely disrupt our daily lives and have huge impact on our economy.

Motivated by this, the course will focus on performance-related issues of networked systems. In the first part, we study capacity planning and modeling for server systems and networks. In the second part, we study the client side of performance while focusing on web applications for both desktop and mobile devices. We address questions like:

- How can we design and engineer networked systems for performance?
- How can we plan server capacity in networked systems?
- How can web applications improve performance across wired and wireless networks?

Onderwijsvorm
Classroom lectures and practical homework assignments.

Toetsvorm
The assessment will be based on both homework assignments and a written exam.

Literatuur
Textbook, supplemented with a reader on Stochastic Performance Modelling.

Vereiste voorkennis
The students should have basic knowledge of computer networks.

Doelgroep
mBA, mCS, mPDCS, mEct

Protocol Validation
**Doel vak**
Learning to use formal techniques for specification and validation of communication protocols.

**Inhoud vak**
This course is concerned with the specification and validation of protocols, using formal methods. The course is based on a specification language based on process algebra combined with abstract data types, called mCRL. This language and its toolset can be used for the specification of parallel, communicating processes with data. Model checking is a method for expressing properties of concurrent finite-state systems, which can be checked automatically. Interesting properties of a specification are: "something bad will never happen" (safety), and "something good will eventually happen" (liveness). In the lab we will teach the use of a tool for automated verification of the required properties of a specification.

**Onderwijsvorm**
4 hours per week HC
4 hours per week WC/PR (mixed)

During the practicum the mCRL tool and the CADP model checker will be used for the validation of protocols discussed during lectures.

**Toetsvorm**
Written exam, together with a practical homework assignment. The overall mark of the course is \((H+2W)/3\), where H is the mark for the homework assignment, and W is the mark for the written exam.

**Literatuur**

**Aanbevolen voorkennis**
Logica en Modelleren

**Doelgroep**
mAI, mCS, mPDCS

**Overige informatie**
The course is taught once every two years, The next opportunity will be in study year 2017-2018

**Research Proposal Writing**
Doel vak
The aim of this course is to learn to read papers at a research level, organize the material for the framework of a seminar talk, and practice presentation skills for such talk. At the end of this course, the student will be able to acquire the prerequisites for reading and understanding a paper by researching the literature on his own, understand the logic of a paper, and be able to critically evaluate a paper. He or she will be able to extract and condense the material for a talk of a fixed length, and give a captivating and interesting talk to fellow students.

Inhoud vak
This course has the single main aim to teach students the first steps of writing a research proposal. Students are asked to evaluate a number of existing proposals that were submitted by staff members in recent years. In addition, each student will also have to write his or her own proposal, which is then evaluated by fellow students following a procedure very similar to what happens in real life. This class may only be attended by PDCS students.

**Vereiste voorkennis**
one specific
Doelvak
Very tough course on security with a focus on systems work. At the end
of the course students will deeply understand the basic notion of memory
corruption attacks (buffer overflows, format strings, etc), network
attacks, SQL injection, cross-site scripting attacks, and other vectors
used by computer hackers. Besides basic attack, students will learn
about state-of-the-art exploitation methods. The course is very(!)
hands-on.

Inhoud vak
The course covers a wide spectrum of security issues. We explicitly
focus on systems security rather than (say) cryptography, as we want to
show students how attackers penetrate systems.

Specifically, the course focuses on (1) network security (sniffing,
spoofing, hijacking, exploiting network protocols, DDoS, DNS attacks,
etc.), (2) memory corruption and application security (buffer overflows,
format string bugs, dangling pointers, shellcode, return oriented
programming, ASLR/DEP/canaries, control flow integrity and cool new ways
of exploitation), (3) web security (XSS, SQL injection, CSRF, http cache
poisoning, SOP, authentication, etc.), (4) botnets (centralised/P2P,
fast flux, double flux), (4) crypto (basics, systems aspects).

Much of the course will be hands-on and challenge-based. In assignments,
student will carry out and investigate attacks in a controlled
environment. This involves programming at the both the highest and
lowest levels (say SQL and assembly).

Onderwijsvorm
Lectures and (very challenging) practical assignments.

Toetsvorm
Written exam (30%) and practical assignments (70%).
Literatuur
No set book. All material will be made available during the course.

Vereiste voorkennis
Knowledge of C is probably essential

Aanbevolen voorkennis
No formal requirements, except a keen interest and a lot of time.
Programming experience
in C very strongly recommended. Knowledge of assembly and computer architecture helps too.

Doelgroep
mCS, mPDCS.

Doel vak
Learning the fundamental notions of term rewriting and getting acquainted with some more advanced topics in the field

Inhoud vak
Term rewriting systems (TRSs) provide for a natural formalism for specifying rules of computation and investigating their properties. TRSs are of basic importance for functional programming and for the implementation of abstract data types. Applications can also be found in theorem proving, proof checking and logic programming. Some topics that will be covered in the course are:
- abstract reduction systems
- critical pairs and Knuth-Bendix completion
- orthogonality and reduction strategies
- termination (rpo's, monotone algebras)
- combinatory logic
- decidability issues
- infinitary rewriting

Doel vak
The Watson Innovation course is a collaboration between VU Amsterdam and IBM. In this course you will learn the basics and challenges of Cognitive Computing and how to train Cognitive Computing Systems. You will have the unique opportunity to work with multidisciplinary teams on real prototypes of IBM Watson, and explore its potential for answering questions about the city of Amsterdam. You will also have a chance to showcase developed applications and plans to real clients.

Inhoud vak
- Basics of Cognitive Computing & IBM Watson
- How to train IBM Watson Instance
- Develop ideas for Cognitive Computing apps
- Build real IBM Watson prototype apps
- Showcase your ideas to real clients

Onderwijsvorm
Lectures & practical sessions at locations of the VU Amsterdam and IBM Netherlands.

Toetsvorm
Evaluation of group projects and individual peer-reviews

Literatuur
Course lecture slides and related articles:
- What is IBM Watson?
- Building Watson: An overview of the DeepQA project
- CrowdTruth papers (http://crowdtruth.org/papers/)
**Doelgroep**
A balanced mix of Computer Science and Business & Economics students (from VU as well as UvA) in their bachelor or master level.

**Intekenprocedure**
Sign up through VUnet and http://crowdtruth.org/course.
For more information contact b.timmermans@vu.nl.

Places are limited, so sign up as soon as possible.

**Overige informatie**
There will be no lectures through the Christmas period. The period from 18 December till 10 January is reserved for students individual and group work. Office hours will be provided for additional feedback and questions.
